Not exactly in the field of VIs but closely related are Simo & Gonzalez, Wanner & Hairer & Lubich, Reich, Betsch, Owren, Celledoni.

Technical Terms

scalar function $\mathbb{R} \rightarrow \mathbb{R}$ $y(x) = x^2$

scalar field $\mathbb{R}^n \rightarrow \mathbb{R}$ $y(\mathbf{x}) = x_1^2 + x_2^2$

functional $\mathbb{D} \rightarrow \mathbb{R}$ $S[\mathbf{x}(t)] = \int_{t_a}^{t_b} \sqrt{x'_1(t)^2 + x'_2(t)^2} \, dt$

vector field $\mathbb{R}^n \rightarrow \mathbb{R}^m$ $\mathbf{y}(\mathbf{x}) = \begin{bmatrix} x_1^2 + x_2^2 \\ x_1^2 - x_2^2 \end{bmatrix}$

operator $\mathbb{D} \rightarrow \mathbb{D}$ $D[y(x)] = \frac{dy}{dx}$

Summary

Directional Derivatives

variations are directional derivatives of functionals

$$J[y(x)]$$

$$J[y(x)] = \int_0^{\frac{\pi}{2}} y(x)^2 \, dx$$

$$\delta J[y, \eta] = \lim_{\varepsilon \rightarrow 0} \frac{J[y(x) + \varepsilon \eta(x)] - J[y(x)]}{\varepsilon}$$

$$\delta J[y, \eta] = \int_0^{\frac{\pi}{2}} 2y(x)\eta(x) \, dx$$

$$y_0(x) = \sin(x), \quad \eta_0(x) = \cos(x)$$

$$\leadsto \delta J[y_0, \eta_0] = 1$$

Extrema of Functionals

First order *necessary* conditions for functionals of type

$$J[y(t), t] = \int_a^b L\left(t, y(t), y'(t)\right) dt$$

and admissible perturbations $\eta(a) = \eta(b) = 0$

$$\begin{aligned} \delta J[y, \eta] &= \int_a^b L_y \eta + L_{y'} \eta' dt = 0 \\ &= \int_a^b L_y \eta - \left(\frac{d}{dt} L_{y'} \right) \eta dt + |L_{y'} \eta|_a^b = 0 \\ &= \int_a^b \left(L_y \eta - \frac{d}{dt} L_{y'} \right) \eta dt = 0 \end{aligned}$$

are the Euler-Lagrange-equations $L_y = \frac{d}{dt} L_{y'}$.

Summary

Extrema of Functionals

Remarks

- ▶ There are a lot of applications in physics and engineering. The classical problems are Dido's problem, Brachystochrone, Catenary, Geodetics, Minimal surfaces, ...
- ▶ The evaluation of *sufficient* conditions (of Legendre and Jacobi) for extrema of functionals is more involved than those of functions and skipped here.

<http://wild.maths.org>

Symmetries are not only beautiful, but also provide practical tools.

example solve the heat equation (selectively) without calculations

Noether's Theorem

[Levi 2014]

If the Lagrangian is invariant under action of a one-parameter family of diffeomorphism h^s (e.g. $h^s \mathbf{q} = \mathbf{q} + s\mathbf{e}$)

$$L\left(h^s \mathbf{q}(t), \frac{d}{dt}\left(h^s \mathbf{q}(t)\right)\right) = L\left(\mathbf{q}(t), \dot{\mathbf{q}}(t)\right),$$

then

$$L_{\dot{\mathbf{q}}} \cdot \frac{d}{ds} \Big|_{s=0} h^s \mathbf{q} = \text{constant.}$$

example

$$L = \frac{1}{2}(\dot{x}_1^2 + \dot{x}_2^2) - \frac{1}{2}c(x_2 - x_1)^2 \quad \text{and} \quad h^s \mathbf{x} = \mathbf{x} + s[1, 1]^T$$

$$\leadsto \begin{bmatrix} m_1 \dot{x}_1 \\ m_2 \dot{x}_2 \end{bmatrix} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix} = p_{\text{total}} = \text{const.}$$

holonomic constraintsVariational
Integrators II
higher order integrators
backward error analysis
thermo-mechanical systems
space-continous systems

Summary

Noether's Theorem

[Levi 2014]

sketch of proof

If the Lagrangian is not altered, neither is the action (here defined by start- and end-position rather than start-position and -momentum)

$$S(t_1, h^s \mathbf{q}_1) - S(t_0, h^s \mathbf{q}_0) = S(t_1, \mathbf{q}_1) - S(t_0, \mathbf{q}_0)$$

After derivation with respect to s

$$\underbrace{S_{\dot{\mathbf{q}}_1} \cdot \frac{d}{ds}}_{L_{\dot{\mathbf{q}}}|_{t_1}} \Big|_{s=0} h^s \mathbf{q}_1 - \underbrace{S_{\dot{\mathbf{q}}_0} \cdot \frac{d}{ds}}_{L_{\dot{\mathbf{q}}}|_{t_0}} \Big|_{s=0} h^s \mathbf{q}_0 = 0$$

Since t_1 is arbitrary the expression $L_{\dot{\mathbf{q}}} \cdot \frac{d}{ds} \Big|_{s=0} h^s \mathbf{q}_1$ must remain constant. Only left to show is $S_{\dot{\mathbf{q}}_1} = L_{\dot{\mathbf{q}}}|_{t_1}$.

Summary

Let the critical function be parametrized by its end position

$$\mathbf{q}(t) = \mathbf{Q}(t, t_1, \mathbf{q}_1)$$

insert into the action function

$$S(t_1, \mathbf{q}_1) = \int_{t_0}^{t_1} L(\mathbf{Q}, \dot{\mathbf{Q}}) dt$$

and differentiate by \mathbf{q}_1

$$\begin{aligned} S_{\mathbf{q}_1} &= \int_{t_0}^{t_1} L_{\mathbf{q}} \mathbf{Q}_{\mathbf{q}_1} + L_{\dot{\mathbf{q}}} \dot{\mathbf{Q}}_{\mathbf{q}_1} dt \\ &= \int_{t_0}^{t_1} \left(L_{\mathbf{q}} - \frac{d}{dt} L_{\dot{\mathbf{q}}} \right) \mathbf{Q}_{\mathbf{q}_1} dt + |L_{\dot{\mathbf{q}}} \mathbf{Q}_{\mathbf{q}_1}|_{t_0}^{t_1} \\ &= L_{\dot{\mathbf{q}}}|_{t=t_1}. \end{aligned}$$

Summary

Point of Departure

HAMILTON'S PRINCIPLE rules the classical mechanics

$$\delta \int_{t_b}^{t_e} L(\mathbf{q}, \dot{\mathbf{q}}) dt = 0 \quad \text{with} \quad L = T(\mathbf{q}, \dot{\mathbf{q}}) - V(\mathbf{q}),$$

typically used for equations of motion

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{\mathbf{q}}} \right) - \frac{\partial L}{\partial \mathbf{q}} = 0,$$

which are often nonlinear and solved numerically.

The Lagrangian $L(\mathbf{q}, \dot{\mathbf{q}})$ lives on tangent bundle
 $L : TM \rightarrow \mathbb{R}$ of the configuration manifold M .

Point of Departure

Equivalently, the system can be brought into Hamiltonian form by the Legendre Transformation

$$H(\mathbf{q}, \mathbf{p}) = \mathbf{p} \cdot \dot{\mathbf{q}} - L.$$

Due to substitution of variables, presuming $\frac{\partial^2 L}{\partial \dot{\mathbf{q}} \partial \dot{\mathbf{q}}}$ regular

$$\mathbf{p}(\mathbf{q}, \dot{\mathbf{q}}) = \frac{\partial L}{\partial \dot{\mathbf{q}}}.$$

The Hamiltonian $H(\mathbf{q}, \mathbf{p})$ lives on co-tangent bundle $H : T^*M \rightarrow \mathbb{R}$ of the configuration manifold M .

The equations of motions then become

$$\begin{bmatrix} \dot{\mathbf{q}} \\ \dot{\mathbf{p}} \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} \begin{bmatrix} \frac{\partial H}{\partial \mathbf{q}} \\ \frac{\partial H}{\partial \mathbf{p}} \end{bmatrix}.$$

Point of Departure

For the simple pendulum

$$L = \frac{1}{2}\dot{\varphi}^2 + \cos \varphi$$

the equations of motion are either (Lagrangian form)

$$\ddot{\varphi} + \sin \varphi = 0,$$

with $\varphi(0) = \varphi_0$, $\dot{\varphi}(0) = \dot{\varphi}_0$, or (Hamiltonian form)

$$\dot{\varphi} = p$$

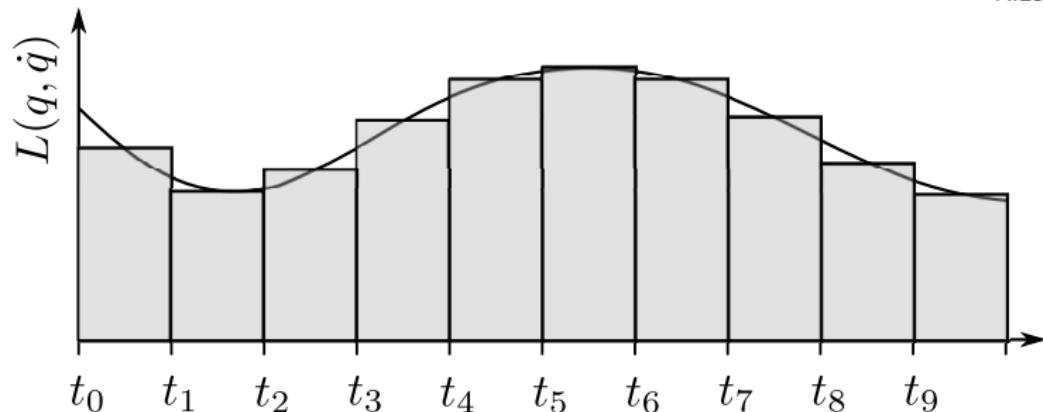

$$\dot{p} = -\sin \varphi$$

with $\varphi(0) = \varphi_0$ $p(0) = p_0$.

Idea behind Variational Integrators

“Approximate the action instead of the equations of motion”

A.Lew

general advantages

- ▶ robustness and excellent long-time behavior
- ▶ symplecticity
- ▶ backward error analysis

VI for Conservative Systems

[Marsden 2000]

Calculus of
Variations

Variational
Integrators I
conservative systems
forcing and dissipation
holonomic constraints

Variational
Integrators II
higher order integrators
backward error analysis
thermo-mechanical systems
space-continuous systems

Summary

① Approximation of the state variables in time

$$\mathbf{q}(t) \approx \mathbf{q}^d(t) = \frac{t_{k+1} - t}{h} \mathbf{q}_k + \frac{t - t_k}{h} \mathbf{q}_{k+1}.$$

② Time-step-wise quadrature of the action-integral

$$\begin{aligned}\Delta S &= \int_{t_k}^{t_{k+1}} L(\mathbf{q}(t), \dot{\mathbf{q}}(t), t) dt \\ &\approx \int_{t_k}^{t_{k+1}} L(\mathbf{q}^d(t), \dot{\mathbf{q}}^d(t), t) dt \\ &\approx h L(\mathbf{q}^d(t_{k+1/2}), \dot{\mathbf{q}}^d(t_{k+1/2}), t_{k+1/2}) = L_d.\end{aligned}$$

$L_d(\mathbf{q}_k, \mathbf{q}_{k+1})$ lives on discrete state space $L_d : M \times M \rightarrow \mathbb{R}$.

VI for Conservative Systems

[Marsden 2000]

Variational
Integrators for
Mechanical
Systems

Dominik Kern

Introduction

Basics from
Calculus of
Variations

Variational
Integrators I
conservative systems
forcing and dissipation
holonomic constraints

Variational
Integrators II
higher order integrators
backward error analysis
thermo-mechanical systems
space-continuous systems

Summary

stationarity condition of the discrete action sum

$$S \approx S_d = \sum_{k=0}^{N-1} L_d(\mathbf{q}_k, \mathbf{q}_{k+1})$$

yields discrete Euler-Lagrange equations

$$\begin{aligned}\delta S_d &= \cancel{D_1 L_d(\mathbf{q}_0, \mathbf{q}_1)} \delta q_0 \\ &\quad + D_2 L_d(\mathbf{q}_0, \mathbf{q}_1) \delta q_1 + D_1 L_d(\mathbf{q}_1, \mathbf{q}_2) \delta q_1 \\ &\quad + D_2 L_d(\mathbf{q}_1, \mathbf{q}_2) \delta q_2 + D_1 L_d(\mathbf{q}_2, \mathbf{q}_3) \delta q_2 \\ &\quad \dots \\ &\quad + \cancel{D_2 L_d(\mathbf{q}_{N-1}, \mathbf{q}_N)} \delta q_N = 0.\end{aligned}$$

D_i denotes derivative with respect to the i .th argument,
i.e. $D_1 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) = \frac{\partial L_d}{\partial \mathbf{q}_k}$, $D_2 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) = \frac{\partial L_d}{\partial \dot{\mathbf{q}}_k}$.

VI for Conservative Systems

[Marsden 2000]

Variational
Integrators for
Mechanical
Systems

Dominik Kern

Introduction

Basics from
Calculus of
VariationsVariational
Integrators I
conservative systems
forcing and dissipation
holonomic constraintsVariational
Integrators II
higher order integrators
backward error analysis
thermo-mechanical systems
space-continuous systems

Summary

The DEL determine $\mathbf{q}_k, \mathbf{q}_{k-1} \rightsquigarrow \mathbf{q}_{k+1}$ implicitly by

$$\underline{D_2 L_d(\mathbf{q}_{k-1}, \mathbf{q}_k) + D_1 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) = 0.}$$

On one hand the I.C. $\mathbf{q}_0, \dot{\mathbf{q}}_0$ correspond to the momenta

$$\mathbf{p}_0 = \left. \frac{\partial L}{\partial \dot{\mathbf{q}}} \right|_{\mathbf{q}_0, \dot{\mathbf{q}}_0}$$

on the other hand the velocity approximation corresponds to

$$\mathbf{p}_{1/2} = \left. \frac{\partial L}{\partial \dot{\mathbf{q}}} \right|_{\mathbf{q}_{1/2}, \dot{\mathbf{q}}_{1/2}}$$

correction by the acting forces between $t_0 \dots t_0 + h/2$

$$\mathbf{p}_0 = \underline{D_2 L(\mathbf{q}_0, \dot{\mathbf{q}})} = -D_1 L_d(\mathbf{q}_0, \mathbf{q}_1) = \mathbf{p}_{1/2} - \frac{h}{2} \left. \frac{\partial L}{\partial \mathbf{q}} \right|_{\mathbf{q}_{1/2}}$$

to be detailed later (discrete Legendre Transform).

Example

1DoF system (dimensionless), e.g. simple pendulum

$$L = \frac{1}{2}\dot{q}^2 - V(q)$$

with linear approximations for the time step $t = 0 \dots h$

$$q \approx q^d = \frac{h-t}{h}q_0 + \frac{t}{h}q_1 \quad \text{and} \quad \dot{q} \approx \dot{q}^d = \frac{q_1 - q_0}{h}$$

and trapezoidal rule for quadrature

$$\int_0^h L(q^d, \dot{q}^d) \approx \frac{h}{2}L(q_0, \dot{q}^d) + \frac{h}{2}L(q_1, \dot{q}^d) = L_d$$

results in the popular Störmer-Verlet scheme [Verlet1967].

$$\delta S_d = 0 \quad \leadsto \quad \begin{cases} p_0 &= \dot{q}^d + \frac{h}{2} \frac{\partial V}{\partial q}(q_0) \quad \leadsto q_1 \\ p_1 &= \dot{q}^d - \frac{h}{2} \frac{\partial V}{\partial q}(q_1) \quad \leadsto p_1 \end{cases}$$

space-continuous systems

Summary

Similarly to the continuous case, there is a discrete momentum definition.

$$\begin{aligned}\mathbf{p}_k &= -D_1 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) \\ \mathbf{p}_{k+1} &= D_2 L_d(\mathbf{q}_k, \mathbf{q}_{k+1})\end{aligned}$$

whose continuity is enforced by the DEL.

Hint, express derived quantities, such as velocities or energies, as functions of \mathbf{q}_k and \mathbf{p}_k , instead of evaluating the approximations $\mathbf{q}^d(t)$!

Discrete Noether Theorem

If there is a one-parameter group h^s that leaves

$$L_d(h^s \mathbf{q}_k, h^s \mathbf{q}_{k+1}) = L_d(\mathbf{q}_k, \mathbf{q}_{k+1})$$

invariant, then there is an invariant of the dynamics

$$I(\mathbf{q}_k, \mathbf{p}_k) = \mathbf{p}_k \cdot \frac{d}{ds} h^s \mathbf{q}_k = \text{constant.}$$

example: two masses connected by a spring

$$L = \frac{1}{2}m(\dot{x}^2 + \dot{y}^2) - \frac{1}{2}c(y - x)^2, \quad h^s \mathbf{q} = \mathbf{q} + [s, s]^T$$

$$\mathbf{p}_0 = -D_1 L_d = \begin{bmatrix} m \frac{x_1 - x_0}{h} - \frac{h}{2} c (y_{1/2} - x_{1/2}) \\ m \frac{y_1 - y_0}{h} + \frac{h}{2} c (y_{1/2} - x_{1/2}) \end{bmatrix}$$

$$\mathbf{p}_1 = D_2 L_d = \begin{bmatrix} m \frac{x_1 - x_0}{h} + \frac{h}{2} c (y_{1/2} - x_{1/2}) \\ m \frac{y_1 - y_0}{h} - \frac{h}{2} c (y_{1/2} - x_{1/2}) \end{bmatrix}$$

$$I = m \frac{x_1 - x_0}{h} + m \frac{y_1 - y_0}{h}$$

Forcing and Dissipation

[Marsden 2000]

Variational
Integrators for
Mechanical
Systems

Dominik Kern

Introduction

Basics from
Calculus of
Variations

Variational
Integrators I

conservative systems
forcing and dissipation
holonomic constraints

Variational
Integrators II

higher order integrators
backward error analysis
thermo-mechanical systems
space-continuous systems

Summary

Discrete Lagrange-D'Alembert principle, derived from time-continuous formulation

$$\delta \int_{t_b}^{t_e} L \, dt + \int_{t_b}^{t_e} \delta W^{\text{nc}} \, dt = \sum_{k=0}^{N-1} \delta \int_{t_k}^{t_{k+1}} L \, dt + + \int_{t_k}^{t_{k+1}} \delta W^{\text{nc}} \, dt = 0$$

L as before and virtual work of non-conservative forces by

$$\begin{aligned} \int_{t_k}^{t_{k+1}} \delta W^{\text{nc}} \, dt &= \int_{t_k}^{t_{k+1}} \mathbf{F}(t) \cdot \delta \mathbf{q}(t) \, dt \approx \int_{t_k}^{t_{k+1}} \mathbf{F}(t) \cdot \delta \mathbf{q}^d(t) \, dt \\ &\approx h \mathbf{F}(t_{k+1/2}) \cdot \delta \mathbf{q}^d(t_{k+1/2}) = \mathbf{F}_k^- \delta \mathbf{q}_k + \mathbf{F}_{k+1}^+ \delta \mathbf{q}_{k+1}. \end{aligned}$$

DEL arranged in *position-momentum* form

$$\begin{aligned} \mathbf{p}_k &= -D_1 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) - \mathbf{F}_k^-(\mathbf{q}_k, \mathbf{q}_{k+1}) \\ \mathbf{p}_{k+1} &= D_2 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) + \mathbf{F}_k^+(\mathbf{q}_k, \mathbf{q}_{k+1}). \end{aligned}$$

Alternative Approach

[Vujanovic 1988]

Variational
Integrators for
Mechanical
Systems

Dominik Kern

Introduction

Basics from
Calculus of
Variations

Variational
Integrators I

conservative systems
forcing and dissipation
holonomic constraints

Variational
Integrators II

higher order integrators
backward error analysis
thermo-mechanical systems
space-continuous systems

Summary

For linear systems with damping

$$\ddot{x} + 2D\dot{x} + \omega_0^2 x = 0$$
$$L = \frac{1}{2}(\dot{x}^2 - \omega_0^2 x^2)e^{2Dt},$$

or forcing

$$\ddot{x} + \omega_0^2 x = a \cos \Omega t$$
$$L = \frac{1}{2} \left(\dot{x} + \frac{a\Omega \sin \Omega t}{\omega_0^2 - \Omega^2} \right)^2 - \frac{\omega_0^2}{2} \left(x - \frac{a \cos \Omega t}{\omega_0^2 - \Omega^2} \right)^2.$$

Generally seems the inverse problem of the calculus of variations to be an interesting approach.

Variational
Integrators for
Mechanical
Systems

space-continous systems

Summary

Geometry of Constraints

Extrema are at points where the gradient of the cost function is normal to the constraint surface

$$\nabla f(\mathbf{x}_0) = -\lambda \nabla \phi(\mathbf{x}_0).$$

Reactions forces are different from external forces, as the constraints have to be fulfilled exactly and not only in some integral sense!

VI for Constrained Systems

[Marsden 2000]

space-continous systems

Summary

Basically it works to enforce the constraints on position level only, better is enforcement on position *and* momentum level.

Iteration equations enforce constraint $\phi = 0$

$$\begin{aligned} \mathbf{0} &= \mathbf{p}_k + D_1 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) - \lambda_k \nabla \phi(\mathbf{q}_k) \\ 0 &= \phi(\mathbf{q}_{k+1}), \end{aligned}$$

while update-equations enforce “hidden” constraint ($\dot{\phi} = 0$)

$$\begin{aligned} \mathbf{p}_{k+1} &= D_2 L_d(\mathbf{q}_k, \mathbf{q}_{k+1}) - \tilde{\lambda}_{k+1} \nabla \phi(\mathbf{q}_{k+1}) \\ 0 &= \nabla \phi(\mathbf{q}_{k+1}) \cdot \frac{\partial H}{\partial \mathbf{p}}(\mathbf{q}_{k+1}, \mathbf{p}_{k+1}). \end{aligned}$$

Alternatively, eliminate the Lagrange-multipliers by the nullspace method [Betsch2005], for VI [Leyendecker2008].

- space-continuous systems

Summary

Crucial point ist the kinetic energy

$$T = \frac{1}{2} \dot{\mathbf{q}} \cdot \mathbf{M}_4 \dot{\mathbf{q}},$$

with the rank-one augmented mass matrix

$$\mathbf{M}_4 = 4\mathbf{G}(\mathbf{q})^T \mathbf{J} \mathbf{G}(\mathbf{q}) + 2\text{tr}(\mathbf{J}) \mathbf{q} \otimes \mathbf{q},$$

where $\mathbf{G}(\mathbf{q})$ relates to the convective angular velocity

$$\boldsymbol{\Omega} = 2\mathbf{G}(\mathbf{q})\dot{\mathbf{q}} \quad \dot{\mathbf{q}} = \frac{1}{2}\mathbf{G}(\mathbf{q})^T \boldsymbol{\Omega}.$$

Potential energy as usual

$$V = mge_z \cdot \mathbf{x}_s = mge_z \cdot \mathbf{R}(\mathbf{q}) \mathbf{X}_s.$$

Summary

Backward Error Analysis

[Hairer & Wanner & Lubich 2006]

Rather than considering how closely the approximated trajectories match the exact ones, it is now considered how closely the discrete Lagrangian (Hamiltonian) matches the ideal one.

Backward error analysis reveals discrete time paths as exact solutions of a nearby Hamiltonian

$$\tilde{H}(q, p) = H(q, p) + hg_1(q, p) + h^2g_2(q, p) + \dots$$

Notion of Thermacy

space-continous systems

Summary

The concept of *thermacy*, also known as thermal displacements, gives heat transfer the same mathematical structure as mechanical motion.

	mechanical	thermal
gen. coord.	x	α
gen. vel.	$v = \dot{x}$	$\vartheta = \dot{\alpha}$
Lagrangian	$L = \frac{1}{2}m\dot{x}^2$	$L = \frac{1}{2}\frac{k}{\vartheta_r}(\dot{\alpha} - \vartheta_r)^2$
gen. momentum	$p = \frac{\partial L}{\partial \dot{x}}$	$s = \frac{\partial L}{\partial \dot{\alpha}}$
eq. of motion	$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}} \right) - \frac{\partial L}{\partial x} = 0$	$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{\alpha}} \right) - \frac{\partial L}{\partial \alpha} = 0$

Introduction

Basics from
Calculus of
VariationsVariational
Integrators Iconservative systems
forcing and dissipation
holonomic constraintsVariational
Integrators IIhigher order integrators
backward error analysis
thermo-mechanical systems
space-continous systems

Summary

Free energy of the spring-damper compound (generalized Maxwell-element)

$$\psi(l, v, \vartheta) = (1 + \beta_c)\psi_e + \mu v^2 - \beta_c v \frac{\partial \psi_e}{\partial l}.$$

The generalized coordinates are $\mathbf{q} = [x, y, \alpha]^T$ and their conjugated momenta

$$\begin{aligned} p_x &= \frac{\partial L}{\partial \dot{x}} = m\dot{x} \\ p_y &= \frac{\partial L}{\partial \dot{y}} = m\dot{y} \\ s &= \frac{\partial L}{\partial \dot{\alpha}} = -\frac{\partial \psi}{\partial \dot{\alpha}}. \end{aligned}$$

time derivatives are obtained from the momenta

$$\dot{x} = \frac{\partial H}{\partial p_x}(\mathbf{q}, \mathbf{p}), \quad \dots, \quad \dot{\alpha} = \frac{\partial U}{\partial s}(\mathbf{q}, \mathbf{p}).$$

higher order integrators
backward error analysis
thermo-mechanical systems
space-continous systems

Summary

Heat transfer (Fourier type, thermal conductivity κ) between spring and environment

$$h = -\kappa(\dot{\alpha} - \vartheta_\infty).$$

Regarding the dash-pot, it is assumed that all energy mechanically dissipated is completely converted into heat, which corresponds to the entropy production

$$\dot{s}_v = \frac{g\dot{v}}{\dot{\alpha}}.$$

Adding the mechanical dissipation up to the previous two effects

$$\delta W^{nc} = -F_v \delta v + \frac{F_v \dot{v}}{\dot{\alpha}} \delta \alpha - \kappa \frac{\dot{\alpha} - \vartheta_\infty}{\dot{\alpha}} \delta \alpha.$$

Summary

Spatial Discretization

Displacement field in a 3D-continuum element

$$\mathbf{q}(\mathbf{x}, t) = \begin{bmatrix} u(x, y, z, t) \\ v(x, y, z, t) \\ w(x, y, z, t) \end{bmatrix}$$

approximated in space first for u (v, w analogously)

$$\begin{aligned} u(x, y, z, t) &\approx \sum N^n(\mathbf{x}) u^n(t) = u^{\text{sd}}(\mathbf{x}, t) \\ \dot{u}(x, y, z, t) &\approx \sum N^n(\mathbf{x}) \dot{u}^n(t) = \dot{u}^{\text{sd}}(\mathbf{x}, t) \end{aligned}$$

leads as intermediate step to a semidiscrete Lagrangian

$$\begin{aligned} L &= \int_V \bar{L}(u, v, w, \dot{u}, \dot{v}, \dot{w}) \, dV \\ &\approx \int_V \bar{L}(u^{\text{sd}}, v^{\text{sd}}, w^{\text{sd}}, \dot{u}^{\text{sd}}, \dot{v}^{\text{sd}}, \dot{w}^{\text{sd}}) \, dV \\ &\approx \mathcal{I}_V^{\text{num}} \left(\bar{L}(u^{\text{sd}}, \dots, \dot{w}^{\text{sd}}) \right) = L_{\text{sd}} \left(\mathbf{u}(t), \dots, \dot{\mathbf{w}}(t) \right). \end{aligned}$$

Time Discretization

Now the continuous system is approximated by discrete one

$$\begin{aligned} S &= \int_{t_b}^{t_e} \int_V \bar{L}(u, v, w, \dot{u}, \dot{v}, \dot{w}) dV dt \\ &\approx \int_0^h L_{\text{sd}}(\mathbf{u}, \mathbf{v}, \mathbf{w}, \dot{\mathbf{u}}, \dot{\mathbf{v}}, \dot{\mathbf{w}}) dt = S^{\text{sd}} \end{aligned}$$

VI construction as before, firstly approximation in time..

$$\mathbf{u}^d(t) = \sum_{m=0}^p M_m(t) \mathbf{u}_m \quad \dot{\mathbf{u}}^d(t) = \sum_{m=0}^p \dot{M}_m(t) \mathbf{u}_m$$

..secondly, quadrature in time (one step)

$$\begin{aligned} S^{\text{sd}} &\approx \int_0^h L_{\text{sd}}(\mathbf{u}^d, \mathbf{v}^d, \mathbf{w}^d, \dot{\mathbf{u}}^d, \dot{\mathbf{v}}^d, \dot{\mathbf{w}}^d) dt \\ &\approx I_t^{\text{num}} \left(L_{\text{sd}}(\mathbf{u}^d, \dots, \dot{\mathbf{w}}^d) \right) = L_d(\mathbf{u}_0, \mathbf{u}_1, \dots, \mathbf{w}_p). \end{aligned}$$

Summary

Summary

Retrospect

Variational Integrators for

- ▶ discrete mechanical, conservative systems;
- ▶ with forcing and dissipation;
- ▶ with holonomic constraints.
- ▶ VIs of higher order,
- ▶ outline of thermo-mechanical coupling,
- ▶ and space-continous systems.

Outlook

- ▶ generalization to optimal control (tomorrow);
- ▶ non-smooth systems, e.g. collisions, friction;
- ▶ event-locator, adaptive time-stepping;
- ▶ electro-mechanical systems, further couplings;
- ▶ combinations of all of them, i.e. higher order VI, constrained, space-continous, coupled,...
- ▶ structure-preserving spatial discretization and model order reduction.
